

THE ANSWER TO YOUR MILLING CHALLENGES

Break free from conventional horizontal and vertical milling with the Schold Variable Speed Immersion Mill. Simply lower the immersion (basket) mill head into your batch—the product is drawn into the work zone, where agitated media efficiently reduces particle size. For thicker or more challenging materials, Schold also offers a heavy-duty, low-speed sweep arm with side and bottom scrapers to help move product toward the basket inlet and maintain consistent turnover.

The immersion milling process delivers faster results than traditional methods, uses smaller quantities of media, and is significantly easier to clean. These advantages make the Schold VIM an ideal solution for batch operations. Changeover is simple: operate the unit in a cleaning tank with detergent or solvent to flush the system, preparing the mill for the next production run.

BETTER MILLING

PRECISE CONTROL & AUTOMATION | Whether you prefer full manual operation, fully automated control with recipes, or something in between, Schold provides the right solution for your process. From simple push-button panels to intuitive touch-screen HMIs, our control options are designed to fit your workflow.

CUSTOMIZATION | The Schold Immersion Mill can be configured with scraper arms, helical arms, or other low-speed blades to match your application. For processes that require maximum vessel flexibility, the system can also be supplied without a low-speed blade.

EASE OF USE | Milling is a demanding process, and equipment must be maintained for peak performance. The modular design of the Schold VIM makes wear-part replacement quick and straightforward, reducing downtime and keeping production moving. Schold also offers complete control packages with recipes and automation for simplified operation.
